	Urgent	Not Urgent
Important	**Do (MVP)** • Import and parse the bank CSV (skipping pending rows and card payments) • Interactive per-transaction categorization with existing categories and an add-new option • Ledger file with duplicate detection • Weekly analysis: total spent and % per category • Monthly summary generated from the ledger	**Schedule (V2.0+)** • Monthly budget setup with estimated income and per-category limits • Remaining-budget report after each weekly categorization, plus month-end over/under budget • Rerun of the monthly analysis on actual income • Balance tracking across checking, savings, and credit accounts • Weekly savings calculation and transfer from checking to savings • Recurring vs. one-time expense tagging
Not Important	**Delegate (use a library)** • CSV parsing, if the handwritten parser gets messy (OpenCSV) • Charts or graphs of spending by category (JFreeChart) • Saving data as JSON instead of plain files (Gson or Jackson) • Weekly reminder to download the CSV (cron or the OS scheduler)	**Delete (cut it)** • Real-time pop-up for every purchase (no bank API access) • Automatic bank login and CSV download (security risk, fragile) • Automatic keyword-based categorization (you prefer to decide yourself) • Mobile app or GUI • Multi-currency support
